# A trip through the Solar System...

## The Solar System:

### Sun

Ø 1 392 684 km

### Mercury

Ø- 4 879.4 km  
Ø- 57 909 000 km

### Venus

Ø- 12 103.6 km  
Ø- 108 146 000 km

### Earth

Ø- 12 756.3 km  
Ø- 149 600 000 km

### Mars

Ø- 6 778.2 km  
Ø- 227 939 000 km

### Moon

### Phobos

### Deimos

Vesta  
Juno  
Asteroid belt  
Ceres  
Pallas

### Jupiter

Ø- 142 984 km  
Ø- 778 360 000 km  
79 moons in total

Callisto  
Ganymede  
Europa  
Io

### Saturn

Ø- 120 536 km  
Ø- 1 433 500 000 km  
62 moons in total

ring system of Saturn; not in scale

Iapetus  
Hyperion  
Titan  
Rhea  
Dione  
Tethys  
Enceladus  
Mimas

### Uranus

Ø- 51 118 km  
Ø- 2 872 400 000 km  
27 moons in total

Miranda  
Ariel  
Umbriel  
Titania  
Oberon

### Neptune

Ø- 49 528 km  
Ø- 4 498 400 000 km  
14 moons in total

Scale (proportions)

☉ = distance of the planet to the sun  
 ⌀ = average- or equatorial diameter

# Swarm: Electrical conductivity of the Earth's mantle

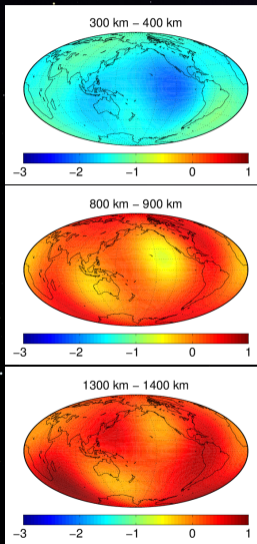

- ▶ accurate measurements of geomagnetic field from low orbits
- ▶ electrical conductivity as an important geophysical parameter related to the temperature, chemical and mineralogical composition of the Earth's mantle
- ▶ part of the Level 2 chains and products
- ▶ radial conductivity profiles with sensitivity estimates
- ▶ towards 3-D conductivity models (Velínský 2013)

# Swarm: Electrical conductivity of the Earth's mantle

- ▶ accurate measurements of geomagnetic field from low orbits
- ▶ electrical conductivity as an important geophysical parameter related to the temperature, chemical and mineralogical composition of the Earth's mantle
- ▶ part of the Level 2 chains and products
- ▶ radial conductivity profiles with sensitivity estimates
- ▶ towards 3-D conductivity models (Velínský 2013)

# Swarm: Magnetic Signatures of Ocean Circulation

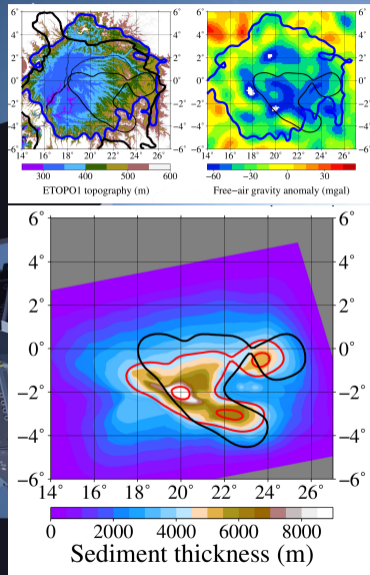

- ▶ wind- and temperature-driven ocean circulation induces secondary magnetic field
- ▶ weak field on the surface but much stronger at ocean depths (Velínský *et al.* 2018)
- ▶ can we detect it in magnetic Swarm data?
- ▶ can we monitor long-term variability of ocean currents by satellite magnetic measurements?

# GOCE: Congo Basin

- ▶ accurate measurements of vertical gravity and vertical gravity gradient from GOCE
- ▶ model GOCO03S up to degree 220
- ▶ Helmert transformation
- ▶ derivation of a refined sedimentary model
- ▶ improved sedimentary model used to determine the vertical density stratification in the southeast Congo Basin (Martinec & Fullea 2014)
- ▶ surface density contrast with respect to surrounding rocks:  $0.24\text{--}0.28\text{ g/cm}^3$
- ▶ decrease with depth of  $0.05\text{--}0.25\text{ g/cm}^3$  per 10 km

# PPGNET: GNSS Network in Western Greece

- ▶ cooperation with University of Patras and the Research Institute of Geodesy, Topography and Cartography; five GNSS stations; observation since November 2013
- ▶ reconstruction of relative motions

- ▶ with respect to Patras (PATR/PAT0): Paravola (PVOG) 12 mm/year NNE; Retsina (RETS) 9 mm/year NNE;  $\rightarrow$  Trichonis Lake normal fault system depicts a slip rate of 3 mm/year
- ▶ with respect to Paravola (PVOG): Rigani (RIGN) and Katochi (KTCH) display SSE movement in accordance with the Katouna strike-slip fault  $\rightarrow$  existence of a microplate in the area

# Mars

# Europa: Formation of Double Ridges

- ▶ GALILEO: double ridges along faults: unique in the solar system
- ▶ friction on the fault may lead to melting  $\rightarrow$  subsurface water lenses
- ▶ lenses are gravitationally unstable, water is quickly extracted (Kalousová et al., *JGR*, 2014)
- ▶ possible mechanism for double ridges formation (Kalousová et al., *JGR*, 2016)

# Europa: Friction on Strike-Slip Faults

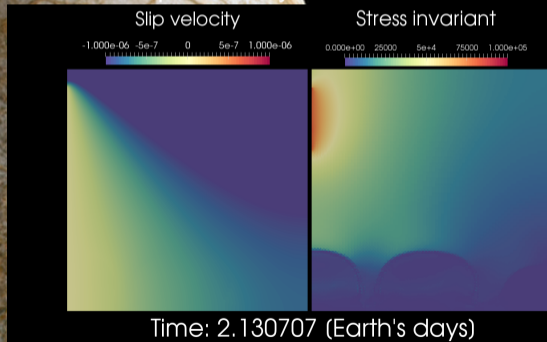

- ▶ morphological observations: near surface water
  - ▶ possible explanation?
  - ▶ friction on strike-slip faults (e.g. double ridge)
- model: tidally loaded strike-slip fault within the ice shell

periodically loaded fault

sketch of strike-slip fault

modelled domain

☉ = distance of the planet to the sun  
 ⌀ = average- or equatorial diameter

# Iapetus

- ▶ CASSINI: equatorial ridge: a unique feature in the Solar System
- ▶ large flattening not consistent with current spin rate
- ▶ possible explanation: collision with another celestial body (Kuchta *et al.* 2015)
- ▶ creation of the ridge depends on initial temperature, rotation, and grain size

# A trip through the Solar System...

# A trip through the Solar System. . . and beyond

Image by ESO, CC4.0

# Tidal heating and spin-orbit locking of exoplanets

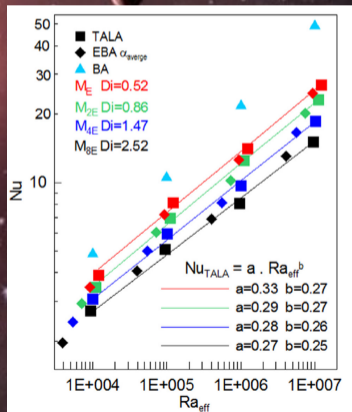

- ▶ Close-in exoplanets: extreme environments, influence of host star, strong tidal loading
- ▶ How much do they differ from the planets in the Solar system?
- ▶ Are they habitable?
- ▶ What is their interior structure and composition?
- ▶ Joint modelling of interior structure with the orbital and spin rate evolution
- ▶ Tidal locking → large temperature contrast on the surface

Proxima Centauri b  
Even small eccentricity of the orbit leads to an extensive tidal heating (volcanic world?)

# Heat transport in large terrestrial exoplanets

- ▶ large terrestrial exoplanets are subject to much higher self-compression than the Earth mantle

- ▶ numerical models that are used to study their internal dynamics often neglect the compressible effects
- ▶ our results demonstrate that compressibility effects are important for mantle dynamic processes and consequently also for formation of planetary atmospheres and the existence of magnetic field through thermal coupling of mantle and core dynamic systems (Čížková *et al.* 2017)

# A trip through the Solar System... and beyond

Our department offers a unique opportunity to students at undergraduate, graduate, and doctoral levels in the area of geophysical and planetological studies, deeply embedded into advanced physical and mathematical framework.
